Education

Indian Institute of Information Technology, Ranchi

2023 – 2027

B.Tech., Electronics and Communication Engineering (IoT and Embedded Systems)

CGPA: 8.00

Experience

UpstageX Private Limited

May 2026 – Present

Co-founder & Engineering Lead

Remote

- Co-founded an AI-powered influencer marketing and UGC platform and shipped it to production: creator discovery and matching across niches, automated contract generation with milestone-based INR escrow, and AI-generated campaign briefs with deliverable tracking and approval workflows.
- Owned the product surface end to end across a six-person team as its largest contributor: scoped the discovery, contracts and escrow, and campaign workflows, decided what shipped in what order, and wrote the specs the team built against.
- Incorporated the company and ran cold outbound to consumer brands, drawing replies and inbound interest from Mamaearth (Honasa Consumer), CASHe, and Ideal Kitchen, then took the objections raised in those calls straight back into the roadmap.

Projects

Suhani | *Kotlin, Android, Sarvam AI, ONNX, SQLite, Python*

2026

- Built a Hindi/Hinglish voice assistant for one real user, a home tailor who now runs her order book by speaking to it. Scoped it by watching how she actually worked rather than from a feature list, and cut the interface to a single button because every extra control was a failure point for a non-technical operator. In daily production use.
- Engineered the full duplex voice loop in Kotlin: on-device Silero VAD and a speaker gate so side conversation in the room never triggers a turn, Sarvam Saaras v4 streaming STT (Hinglish code-mix), a Sarvam-105B tool-calling brain, and Bulbul v3 streaming TTS over a local SQLite ledger with transliteration-aware fuzzy client matching.
- Chose the model configuration empirically rather than by taste: built a bake-off harness and scored roughly 1,200 calls, landing on a setup that cut time-to-first-token to 1.0–1.3s, and moved date arithmetic out of the model into a deterministic tool after scoring exposed invented due dates.
- Treated correctness as the product requirement rather than a nice-to-have, because the user cannot debug it: every ledger write is idempotent, prompts are regression-tested at 300/304, and 56 unit tests gate every build.

BitTorrent Client | *Node.js, Electron.js* | [GitHub](#)

April 2025

- Implemented the BitTorrent protocol from scratch in JavaScript with zero native modules: bencode encoding/decoding, tracker communication, peer handshake, and the peer wire message protocol.
- Downloaded pieces concurrently from multiple peers with per-piece SHA-1 integrity verification, and seeded completed files back into the swarm.

StreamThreads | *React, Firebase, Chrome Extension MV3* | [Chrome Web Store](#)

June 2024

- Published a live Chrome extension on the Chrome Web Store that injects a shared, per-title comment thread into Netflix, Prime Video, and JioCinema, so viewers on different services discuss the same title in one place.
- Normalised titles across three platforms with different DOM structures and URL schemes onto a single canonical thread backed by Firebase.

Achievements

- 1st Runner-up**, HyperVerge Hackathon 2024. Built Widget Manager as a two-person team: a Chrome new-tab extension with 14+ productivity widgets including a Pomodoro timer and Spotify player (React, Google Apps Script).
- 2nd Runner-up**, Quasar 2.0 Hackathon, IIIT Ranchi 2025, from 48 qualified teams, for a Puppeteer crawler that walks an entire site and reports every dead link ([GitHub](#)).

Certifications

- Master Product Management by actually building a Product** | Udemy, Anna Kolenkina (FutureVersity) | [Certificate](#)

Technical Skills

Languages: Python, TypeScript, JavaScript, Kotlin, C, C++, SQL, Embedded C

Frameworks: React, React Native, Android, Node.js, Express.js, FastAPI, Tailwind CSS

Data & Infrastructure: PostgreSQL, MongoDB, SQLite, Redis, Firebase, Docker, Git, AWS

AI & Voice: LLM tool-calling, streaming STT/TTS, on-device VAD (ONNX), prompt evaluation harnesses

Product: Requirements and specs, user research from direct observation, roadmap prioritisation, cold outbound and customer discovery

Core CS: Data Structures & Algorithms, Operating Systems, DBMS, Computer Networks, OOP

Electronics & Embedded: Arduino, Embedded C, Sensor Interfacing (MQ, DHT11, IR), UART / I2C / SPI
